We have presented last year the Application Lifecycle Management for automation systems. The codeBeamer ALM provides full solution for industries which must meet compliance with specific standards. This year we have introduced the application of codeBeamer ALM at 3 major users in Hungary who started to use the product to switch from classical document (paper) based practice to a completely electronic solution in their projects. The tool manages all requirements, automation design, the review and approval procedures, test planning and test execution while organizing versioned document storage and user collaboration around a relational database. Controsys would like to share the initial experiences gained in the real digital transformation procedure using codeBeamer in a progressive and also in a conservative industrial environment. The presentation details the ALM introduction steps made at industrial automation supplier and at end users, also details the human reception experiences.
